

FOR BUSINESS

AI systems I run my own business on

A content system from idea to payment, a shared memory for people and agents, and work to order. No prices: I name the cost before we start.

Full-cycle content system: from idea to payment

Ten steps — how each runs for me and whose work it takes over.

- 01 Idea.** I say it by voice in Telegram — the note lands in my base of tasks and ideas — instead of an assistant
- 02 Creation.** Agents write posts, carousels, reels and captions, and check facts and Meta's rules — instead of a copywriter, designer, editor
- 03 Distribution.** TryPost on a schedule with no empty days: 17 accounts on six networks (as of 17.10) — instead of a social media manager
- 04 Control.** A watchdog agent reads the publishing queue and warns me about failures — instead of checking by hand
- 05 Conversations.** A keyword in the comments gets one direct message within Meta's rules; chats in one console — instead of a messaging manager
- 06 Funnel.** Channel pin → bot → free lesson → review → club or shop — instead of leading people by hand
- 07 Sale.** Card payment via Stripe; a subscription is cancelled with one button — instead of a sales manager
- 08 After payment.** A numbered invoice and the files by email by themselves; licence and corrective invoice on refund — instead of part of bookkeeping and support
- 09 Analytics.** One report in the bot: came through a link → lesson → request → payment — instead of an analyst
- 10 Memory.** Second Brain: agents remember decisions and do not start from scratch — instead of asking whoever remembers

Where to start: a review and an implementation plan

A paid start for any of the systems: I look at your processes and data, then send a written plan and a short video. I name the cost before we begin, and it is credited if you go on with the system.

Second Brain

Shared memory for you, your team and your AI agents. Since April my agents write a digest of every session into a shared base — a new agent finds an earlier decision.

On your own

The Librarian Starter Kit: your agent in Claude Code or Codex installs the memory step by step. **The kit**

Done for you

I connect your Claude or Codex to a shared memory, move your notes and set up 2–3 scenarios.

For your team

Shared memory for the team and its agents, access rights, training, optional support.

More about Second Brain: brain.sl-sp.de

AI for mail and invoices on your own hardware

A local model in your office collects invoices from a mailbox, reads them and files them for your bookkeeping. It runs on your hardware: emails and invoices are not sent to cloud AI services. A custom setup; the hardware is paid separately.

More

What else I build to order

An AI agent in Telegram. My assistant Smith: tasks, a plan in the morning, a summary at night

Night agents. Form checks on my sites every 2 hours, SEO

Mail in one window. An agent drafts replies, I press send

Talk about your case
